

Construction Services

Agility in Application Development

Delivery of enterprise solutions requires a deep understanding of application architectures, object oriented design principles, development tooling & methods, and increasingly diverse deployment environments.

Odecee's construction services are geared towards the development of enterprise systems using JEE, Java and other industry standard languages and frameworks.

Our focus is delivery and we ensure success through strong controls, technical leadership and the art of simplicity.

High quality software delivered fast.

Delivering software that meets your customer's expectations is challenging. Today's agile methods and techniques promise fast delivery and high quality software. But methods alone don't come bundled with insight, experience, innovation and good old-fashioned know-how.

At Odecee, we combine world's best practices in software engineering with a team of professionals who are delivery-focussed, believe that simple solutions are always the best

response to complex problems and understand what it takes to deliver a Wow! Experience to our customers.

We have invested and specialised in building and implementing Java Enterprise Edition-based software systems. Our consultants are highly skilled and technically proficient in the industry's best commercial and open-source software solutions.

We know that every part of the software engineering lifecycle is a critical cog in a complex machine. That's why we've also built an automation service capability that compliments and supports our construction services through continuous integration and automated unit and shakeout testing.

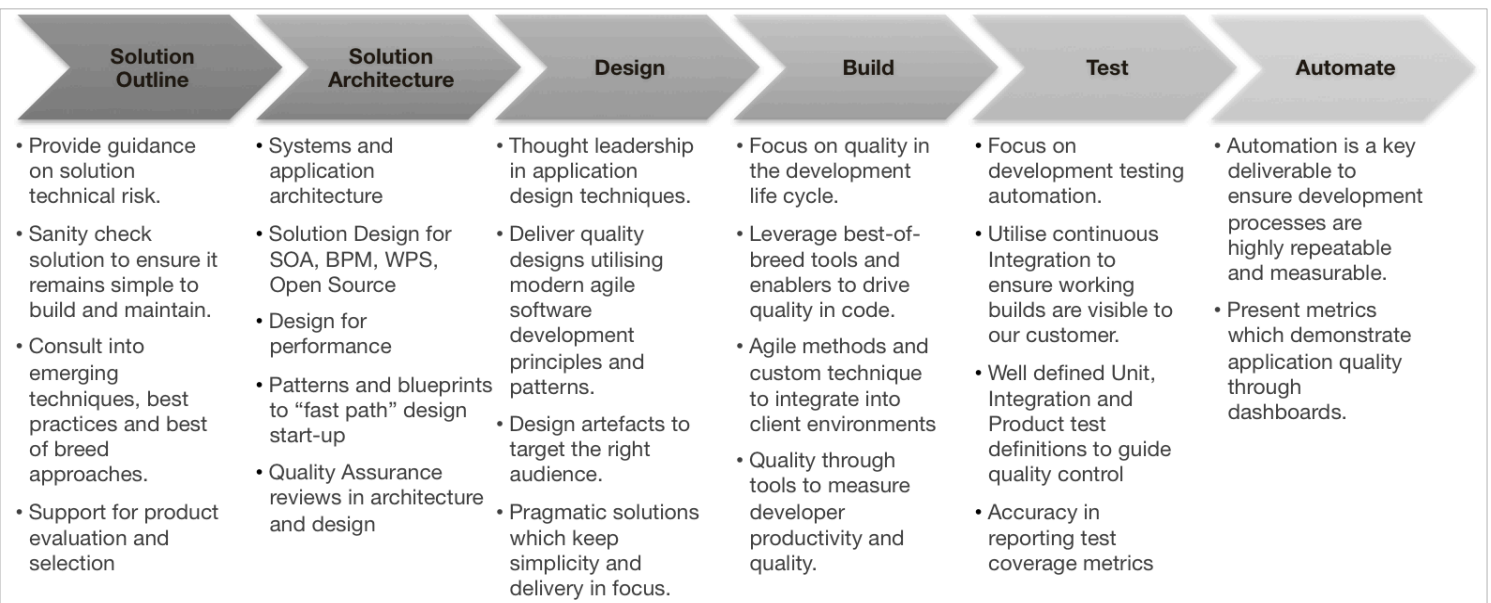

Odecee Expertise

Great systems don't get delivered without great tools and enablers. Our consultants are trained and experienced in delivering enterprise-grade software solutions using the best commercial and open-source solutions available.

Rational software

WebSphere software

Odecee construction services offer an end-to-end application delivery capability, from solution outline through to implementation. We understand that the key to success is through teaming. That's why we endeavour to make every relationship a trusted and lasting one. Talk to us about how our software development services are different and how we can assist you in your delivery success.

Software that works

Odecee's **construction** capabilities can be leveraged individually or as an integrated set of services.

Solution Architecture

With the art of simplicity in mind, our software architects are trained and experienced in designing solutions using the latest technologies and solution enablers such as SOA, BPM, Portal, mobile and cloud computing.

Our technology blueprints in architecture and design help reduce technical and delivery risk in both package implementation and custom development projects.

Design

Describing the problem is sometimes just as hard as designing the solution.

Without a design that demonstrates how you will address your business requirements and how it will be implemented by your architecture your delivery will most likely fail.

Requirements traceability, delivery approach and quality management all needs to be designed along with the solution. Our team understands this and knows how to match method with technology and the environment they are working in.

Application Development

There are three good reasons why projects fail: execution, execution...

A lack of expertise in execution will have serious consequences. When it comes to building software – be it implementing a package, building a bespoke solution or customising a framework – experience and understanding of the technology you are using is critical.

At Odecee, we don't just talk about expertise, it is one of our core values. ExpertTeams are what we nurture and what we integrate into your environment.

We have significant experience and a proven track record in various development methodologies (RUP, XP, FDD, Scrum, traditional waterfall and client-specific methods) and our engineers are technically proficient in the technologies and best practices they develop for.

Quality Assurance

At Odecee, we are proud of the software we produce. We strive to provide our customers with the most robust and well-tested software possible.

The importance of early testing in the development lifecycle is well understood by our software engineering champions. We adopt test-driven development and early defect detection techniques, set our quality bar high and then implement the right strategy of unit, component, integration, performance and shakedown tests.

Of course there's no point testing if the right development controls are not in place. Code reviews, audits, dependency checks and stringent coverage reports are all part of the extensive testing and quality framework we employ.

Leadership

Our technical project management capabilities and software engineers work seamlessly with your team to optimise and deliver your project success.

Contact us to discuss your solution needs.

Fast, Simple, Software

Company Profile

Headquarters
Melbourne, Australia

Founded
2007

Company Description

Odecee is a software engineering consultancy specialising in enterprise-grade software delivery via three core service offerings – enterprise software **Construction**, **Performance** engineering, and environment management & build **Automation**.

Our services and agile techniques are world's best practice and optimised for delivery of business solutions using IBM Rational's software development platform and the IBM WebSphere solution stack.
